

DocType Features

Naming

Default `name` for each record is a randomly generated hash unless we enter values to Auto Name field (e.g. **field:article_name** will automatically set each new record `name` with the `article_name` value). Note that this means each `article_name` has to be unique since `name` is a **primary key**.

Form Layout

We can add Column Break, Section Break, and hide Image field as it will be shown on the top left of the form instead (it's one the Form Settings, set the Image Field).
