

# Sites

Frappe is a multitenant platform and each tenant is called a site. A site has its own database. Sites exist in a directory called `sites`, assumed as the current working directory when running a bench command.

While responding to an HTTP request, a site is automatically selected based on,

- `Host` header in the HTTP request matches a site
- `X-Frappe-Site-Name` header in the HTTP request matches a site

To force a site to be used as the default site, run the following command:

```
bench use mysite.local
```

After running this command, site specific commands can be run without the `--site` parameter.

For example, instead of running:

```
bench --site mysite.local migrate
```

You can just run:

```
bench migrate
```
