Multitenancy (Development Mode)

Port-based Multi-tenancy

> 🗒
> **Note that this only works temporarily** (you can't send a `bench serve` instance to the background and have the site still up and running, only the site ran using `bench start` will be able to be sent to the background)

1. Create both sites as usual
2. Add `sites` key to the `common_site_config.json` and specify both app's `webserver_port`. Example:

   ```
   ...
   "sites": {
     "coval-testing": {
      "webserver_port": 8001
     },
     "tcs": {
      "webserver_port": 8000
     }
    },
    ...
   ```

3. Run `bench start` for the first/primary site
4. Open up a new terminal, run `bench serve --port port-number` for the second site. Now both sites is running simulataneously

> 🗒
> To actually run 2 sites simultaneously using nginx forever on development mode, use 2 separate benches
